

NOTE: the yellow outline represents the general project location area and does not indicate right-of-way needs for any proposed alternatives. Potential right-of-way impacts are determined through the environmental process and will be addressed in the draft environmental document for public review in mid-2023. The draft environmental document will contain sufficient preliminary engineering and environmental study information to determine potential alignment and right-of-way needs for the project. Moreover, potential alignments and right-of-way needs can only be definitively confirmed once they have been analyzed in the Final Design process.
